

WHAT IS CLAIMED IS:

1. A carrying handle of a luggage case, comprising:
a grip including two end extensions each having an elongated opening;
5 two connecting mechanisms at both ends of the grip, each connecting mechanism including a cap and a first post extended downward from the bottom of the cap wherein the first post is inserted into the elongated opening and the luggage case and the connecting mechanism are fastened together by a first fastening member through a top of the luggage case into the first post; and
10 two bellows mechanisms each including a bellows member interconnected the end extension of the grip and the connecting mechanism,
whereby lifting the grip will move the extensions of the grip toward a center of the grip and the bellows mechanisms is expanded toward the center of the grip until one end of either opening is stopped by the first post and a space
15 between the grip and the top of the luggage case is formed .
2. The carrying handle of claim 1, wherein the bellows mechanism further comprises a supporting member at one end and a neck interconnected the bellows member and the supporting member.
20
3. The carrying handle of claim 1, wherein the bellows member has a section of substantially elliptical shape.
4. The carrying handle of claim 2, wherein the connecting mechanism further
25 comprises a recess open to one end and two inwardly extending stops at opposite sides of the recess so as to fasten the supporting member in the recess.

5. The carrying handle of claim 1, wherein the other end of either elongated opening of the grip is engaged with the first post in a nonoperating position.

6. The carrying handle of claim 1, wherein the connecting mechanism further
5 comprises a second post provided in a position parallel to the first post and outside the elongated opening of the grip wherein the luggage case and the connecting mechanism is further fastened together by a second fastening member through a top of the luggage case into the second post.
